

---

Melodyne Studio Edition is a plug-in that allows you to use a guitar or MIDI controller when recording to add natural phrasing, dynamics, and vibrato. In this article, we're going to walk you through the steps of downloading and installing this software in addition to how you can use it in the studio. We'll also talk about how it compares with other similar plug-ins. Finally, we'll cover some of the features included with Melodyne along with a few tutorials so you can get up and running in no time!

Computer Annoyances: So much more than your average virus... By: Scott Huvencers Date: October 2006

Article is 6 pages long.

Landscape : 6 pages- 10 images, no contact form or about us "blurbs" that I could find. Article is 6 pages long.Landscape : 6 pages- 10 images, no contact form or about us "blurbs" that I could find.

Note This article contains mild profanity - not at all outrageous but it is there. To be honest I find the overuse of swearing in some music trends kind of offensive too so while this is present in this article it isn't over used which I think makes it more acceptable.

Of all the things on the Internet which annoy you I'm willing to bet viruses are at or near the top of that list. These insidious buggers might not cripple your computer or shut down your system but they can take you down in other ways. They can keep you from getting work done by locking up your computer, slow you down by taking over valuable hard drive space, and even make it so you don't show up when someone is searching for you on Google. That's right, the mere mention of a virus can actually hurt your Google ranking.

In this article we'll look at why this is so and what you can do about it.

What is a virus?

A computer virus is a small program designed to replicate itself and spread from one machine to another. Most viruses are actually just plain old programs that have been corrupted in some way – usually by being hacked – so that they gain the ability to replicate themselves and transmit themselves from machine to machine without needing a user's help. The content of these programs doesn't really matter, either – they could be documents or music files as easily as executable files.

Once a file is hacked and turned into a virus it can be transmitted from one device to another as long as those devices are on the same network. This means that the virus can spread from your computer to your home server, or from your home server to someone else's computer. It doesn't matter if those computers are powered off or not – the virus will still work and start replicating itself.

What can you do about it?

Can you run away?

The short answer – No – because of constant changes in technology and the increasing power of viruses we can't really expect you to run away from all of them forever.
